

## ABSTRACT

A solid electrolytic capacitor (A1) includes a first and  
5 a second anode terminals (11a, 11b) projecting in different  
directions from each other. Preferably, a metal cover (22)  
for electrically connecting the anode terminals (11a, 11b) to  
each other is provided. With such an arrangement, the ESR and  
the ESL can be reduced, and the high frequency characteristics  
10 can be enhanced.
